## Fisheries Management – challenging framework conditions

Marine life – our common responsibility

www.fiskeridir.no

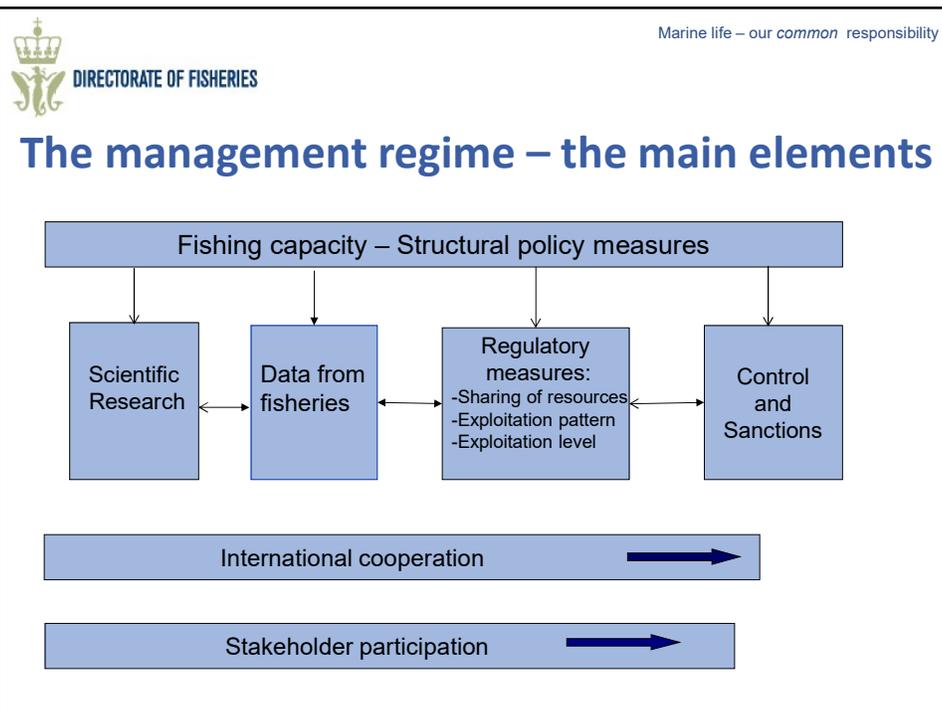

## Modern Fisheries Management – main issues and tasks

1. Managing structure and capacity of fishing fleet – reduction of excess capacity
2. Improving exploitation patterns and reduction of unwanted fishing mortality and waste
3. Implementation of sustainable and precautionary harvest levels (quotas) – Harvest Control Rules
4. The sharing of limited resources – internationally and nationally
5. Effective monitoring, control and enforcement (MCS) of management measures – sanctions
6. Moving from single species to an ecosystem based fisheries management
7. Cross sectoral challenges: environmental, aquaculture, oil and gas etc.

Marine life – our common responsibility

## Fisheries management is a complex, multidisciplinary business:

- Marine sciences (biology, oceanography, ecology etc.)
- Statistics, IT and GIS
- Economics (social, resource, business)
- Fisheries technology and knowledge
- Sociology, anthropology, psychology
- Negotiation capabilities, diplomacy
- Political science, history, jurisprudence
- Lawmaking and regulations
- Law enforcement and sanctions
- Communication

**And importantly – as cogs in a clockwork– the disciplines must work together!**

## Conclusion

- Knowledge and advice from marine science is of course vital input to fisheries management. But it is far from enough in achieving good governance. It is simply the first step.
- The biggest challenge in achieving good governance is the development and financing of robust and incorrupt management institutions, comprised of competent staff in a number of disciplines, able to transform scientific advice and other input into viable fisheries management.

**Thank you for listening**
